

# Match the Invaders!

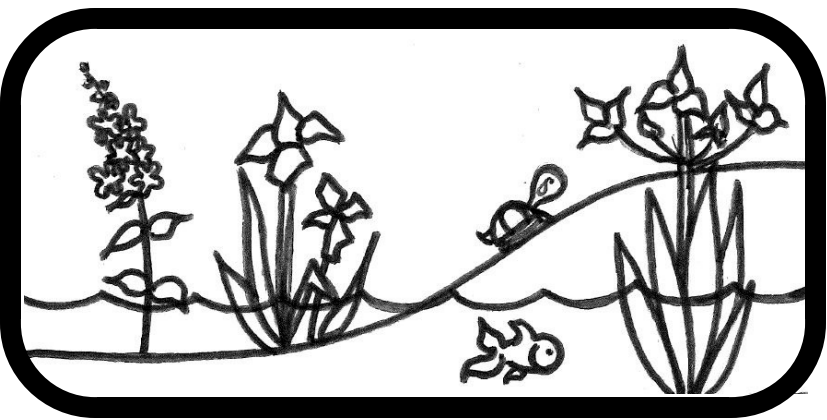

Match the picture on the left with the correct description on the right

**Invasive species are found on land but also in water systems! Did you know... some are pets that were let loose into the environment!**

**Native species have lived in BC for a very long time. They evolved as part of the ecosystem and provide food and shelter for animals and people.**

**Introduced or non-native species were brought to BC by people. Some - like many foods we grow - do not become invasive in their new environment.**

**Invasive species are often brought to BC by people for food, medicine, or just because they are pretty! They can take away food and habitat from BC's native species.**
